AUTHOR: Kozyrev, N.A., Doctor of Physico-Mathematical  
Sciences (Pulkovo)

TITLE: Scientific News. Volcanic Activity on the Moon

PERIODICAL: Priroda, 1959, Nr 3, pp 84 - 87 (USSR)

ABSTRACT: After dealing in detail with the morphology of the moon surface and the possibility of tectonic activity on the moon, the author states that in October and November 1958, he and V.I. Yezerkiy, Astronomer of the Khar'kovskaya observatoriya (Khar'kov Observatory), were engaged in spectral research of Mars with a 50-inch reflector at the Krimskaya observatoriya Akademii nauk SSSR (Crimean Observatory of the AS USSR). On this occasion, the author decided to obtain, simultaneously, photometrically standardized spectrograms of some parts of the moon, in particular of the crater Alphonse, in order to solve the problem of the possibility of gas emanation.

Card 1/3

SCV/26-59-3-14/47

Scientific News. Volcanic Activity on the Moon

He then describes, with the aid of 3 spectrograms, how in the early morning of 3 November 1958, in the central peak of the Alphonse Crater, an extremely interesting phenomenon - a volcanic process - took place. At the beginning, volcanic ashes were thrown out, followed, as usual, by gases. The emanation of gas took place, apparently, from magma lifted to the surface. The former must contain gases adsorbed in depths under high pressure. In the aggregate, the phenomena observed proves that in the central peak of the Crater Alphonse, a genuine volcanic eruption had taken place. At any rate it could not have been a poor emanation of gas from the fissures of the moon surface which was evidently observed by D. Olter. It also proves that the internal energy and possibility of mountain forming processes have survived on the moon until the present time. There are 2 photographs.

		<p>1974. Review of stellar spectra and a theory of internal constitution of stars. N. A. KOZYREV. <i>Contr. Crimean Astrophys. Obs.</i>, 2 (1945) in Russian.</p> <p>At the outset the author states that this is an attempt to solve the problem outlined in the title by an analysis of empirical laws deduced from astrophysical observations and not by methods involving <i>a priori</i> assumptions. His results, he says, are at variance with usual ideas on the internal structure of stars. His main conclusions follow: (1) radiation pressure does not play a significant role in any star, not even in a supergiant; it can be neglected in comparison with gas pressure; (2) the inner regions of stars are composed almost entirely of H (with a mean molecular weight near to 1); (3) the absorption of light is caused by Thompson scattering produced by free electrons; (4) stellar structures closely resemble polytropic gas spheres with <math>n = 1</math>. The combined results make possible approximate computations of physical conditions in stellar interiors, the observed L, M and R being used as a starting point. Thus a temperature of 6 million degrees is obtained for the centre of the sun, much too low for any thermonuclear reactions, he says.</p>

"Glowing of Night Sky on Venus," Izv. Krymsk. astrofiz. observ., No 12, pp 169-176, 1954

Attempt was made to obtain the emission spectrum of the glowing atmosphere of Venus. The 50-inch reflector of Crimean Astrophysical Observatory and a quartz spectrograph were used for taking pictures in H $\gamma$  light of the dark limb of the planet. Emissive bands of H $_2$  could be revealed corresponding to terrestrial polar lights. Other emissive bands could not be identified, pointing to abundance of some complex unknown molecule. The night sky glow on Venus was evaluated as 50 times stronger than on earth. (RZhAstr, No 7, 1955)

Sum. No. 681, 7 Oct 55

KozyREV, N.A.

1. Summary of the data obtained in the  
 1961-1962 expedition to Venus. The  
 data were obtained by means of 18 spectrograms  
 of the Venus spectrum in the region  $\lambda$  3800- $\lambda$  6500  
 with the use of a spectrograph with a slit width of 18  
 microns and a dispersion of 22 Å/mm. The data were  
 obtained on September 20, 21, and October 2, 1961. The  
 data were obtained before the conjunction of Sep-  
 tember 20, 21, and October 2, 1961. The data were  
 obtained in the morning 8.5 hours after  
 sunrise. The data were measured by  
 Moll microphotometer. A comparison curve of the logarithm  
 of the ratio of the intensities of Venus light to the solar light  
 against the wave length was plotted. This gives microchro-  
 matic albedo curve spectrum, since the ratio for  $\lambda$  5500 is  
 taken as 1. The analysis of this curve shows that real ab-  
 sorption practically does not exist for red rays. The micro-  
 chromatic albedo decreases in the blue region of the spec-  
 trum, which indicates an increase of real absorption. At  
 $\lambda$  4500 the curve breaks and sharply decreases towards the  
 ultraviolet region. This is attributed to real absorption.  
 On the averaged curve, peaks of absorption in the violet  
 region at  $\lambda$  4378 and 4130 are clearly visible. These peaks  
 are also visible on the reproductions of the tracings. In  
 addition to CO<sub>2</sub> and N<sub>2</sub> there are other gas molecules. Changes  
 within these molecules cause the dark streaks and spots in  
 ultraviolet light on the disk of Venus. The streaks are  
 probably connected with the condensation of the mol. from  
 its gaseous form, which defines clear weather on Venus.  
 This is similar to the condensation of water vapor, which  
 yields clear weather on Earth. E. received a value of 0.81 as  
 the thermal albedo of Venus. From this E. derived its ef-  
 fective temp. to be -60°C, at the same time the temp. of the  
 stratosphere should be about -90°C. Rom. Zelinski.

TITLE: Microelectronics based on thin film technology [The paper was presented at the Section Meeting entitled "Problems of microelectronics" at the Scientific Congress held in Leipzig from 8 to 9 March 1965] III

SOURCE: Nachrichtentechnik, no. 8, 1965, 287-292

TOPIC TAGS: microelectronics, microelectronic thin film, electronic circuit, microelectronic circuit, solid state device

ABSTRACT: The need for the reduction in size of the electronic equipment and the successes achieved in this direction in the Western world prodded the Ceramic Factory Hermsdorf to start in 1960 the development (in a manner similar to the RCA micromodule technology program) of miniaturized electronic circuits which could be gradually expanded in parallel with the growth of the technological means. The article reports on the advances in this direction at the factory during the 1960-65 period. The development was carried out in agreement with the modern views concerning the economical automatic production of complex circuit-building elements and it resulted in the creation of the so-called KME series of complex microelectronic elements. The description of the mastering of the thin film-hybrid technology, of the operational

AUTHOR: Krahokoupil, J.

TITLE: X-ray quantometer with bent analysing crystal\*

PERIODICAL: Československý časopis pro fysiku, no.3, 1962, 235-239

TEXT: The description is given of a new type of X-ray quantometer, which permits simultaneous determination of up to nine elements by means of one analysing crystal. Single CdS crystals, developed at the Solid State Research Institute, German AS, Berlin, were used as photoconductive detectors. They have a photosensitive rectangular face only a few tenths of a millimetre wide. The primary emission from an X-ray tube excites the secondary emission from the sample to be analysed. This falls onto a bent analysing crystal. Several photocells are placed on the focusing circle of the crystal in the positions into which the  $K\alpha_{12}$  radiation of the respective elements falls. The monochromatic secondary X-rays falling onto the cells cause a current to flow. The described apparatus was not built completely because only two photocells were available to the author. The feasibility of the method was tested by analysing

Card 1/2

the nickel content in steel. It was found that the described apparatus was simpler than the previous ones because of the small detectors used, and permits the simultaneous analysis of a greater number of elements (up to several dozens). The photocell had a considerable time constant and it took about 10 minutes for it to reach equilibrium. The long time constant could be eliminated by background illumination with weak light. Under these circumstances, the intensity can be measured with an accuracy of about 5% or better. The sensitivity is not as high as with large counters but appears to be adequate. There are 4 figures.

"Sudden onsets of magnetic disturbances (SSC) noted in Raciborz 21 May 1958 to 31 December 1961."

ACC NR: AP7000255

SOURCE CODE: PO/0026/66/014/003/0229/0246

AUTHOR: Krainski, Waldemar

ORG: Geophysical Institute, PAN (Zaklad geofizyki PAN)

TITLE: Magnetic storms with sudden commencement recorded at the Raciborz station between 21 May 1958 and 31 December 1961

SOURCE: Acta geophysica polonica, v. 14, no. 3, 1966, 229-246

TOPIC TAGS: magnetic storm, ~~storm distribution~~, geomagnetic <sup>field</sup>, geomagnetic time, ~~field component~~, ~~geomagnetic meridian~~

ABSTRACT: Data obtained from recording one hundred magnetic storms with sudden commencement at the Raciborz station were processed. This study included data of the diurnal rate, amplitudes of oscillations, vector directions, and the distribution of storms at various hours during one day. The diurnal distribution of amplitudes at Raciborz was compared with that of several observatories with low geomagnetic latitudes. Processing data are given in a table which contains the universal time and the geomagnetic time of the beginning of the storm and the state of magnetic field expressed by components of the magnetic field and their variations. Geomagnetic time is used for statistical investigation, and storms were classified according to the types introduced by S. Matsushita. All pulses, positive and symmetric, in the horizontal component have been related to the type SC.

Card 1/2

ACC NR: AP7000255

The diurnal rate of logarithms of oscillations in the horizontal component may be expressed by a sinusoidal curve. Deviations of pulses from geomagnetic meridians and their amplitudes are represented graphically. The maximum deviation takes place in the morning hours. Orig. art. has: 8 figures, 1 table, and 7 formulas.

Organizatsiya ucheta materialov na mashinostroitel'nom predpriyatii (Organization of Materials Control at Machine-Building Establishments) Moscow, Mashgiz, 1959. 151 p. Errata slip inserted. 5,000 copies printed.

Reviewer: I.L. Turetskiy, Docent; Ed.: V.G. Kovalevskiy; Managing Ed. for Literature on Machine-Building Technology (Leningrad Division, Mashgiz): Ye.P. Naumov, Engineer; Ed. of Publishing House: M.A. Chfas; Tech. Ed.: L.V. Sokolova.

PURPOSE: The book is intended for production engineers and economists specializing in industrial-operations analyses and materials-control policies applicable to machine-building plants.

COVERAGE: The book deals essentially with three aspects of production-control management: 1) procedures and recordkeeping activities of materials-control bodies and the organizational setup of such bodies; 2) planning, layout, and functions of storekeeping, including materials and equipment recordkeeping

TITLE: Wear and damage to the Parts and Units of the M-601 Engine  
(Ob iznose i povrezhdeniyakh detaley i uzlov dvigatelya M-601)

PERIODICAL: Energeticheskiy byulleten', 1958, Nr 8, pp 27 - 32 (USSR)

ABSTRACT: The M-601 engine ( a modification of the M-50 engine ), in conjunction with the SA-700 power drive equipment, is now being introduced extensively into oilfields for drilling, pumping etc, as a replacement for less powerful drives, such as those with B2, 8S230r engines. The article takes each part in turn and lists the damage, flaws and wear that may develop, making recommendations for the repair and maintenance of the engine. There are 4 photos, 1 table and 1 diagram.
